

Silent Scheduler for iOS

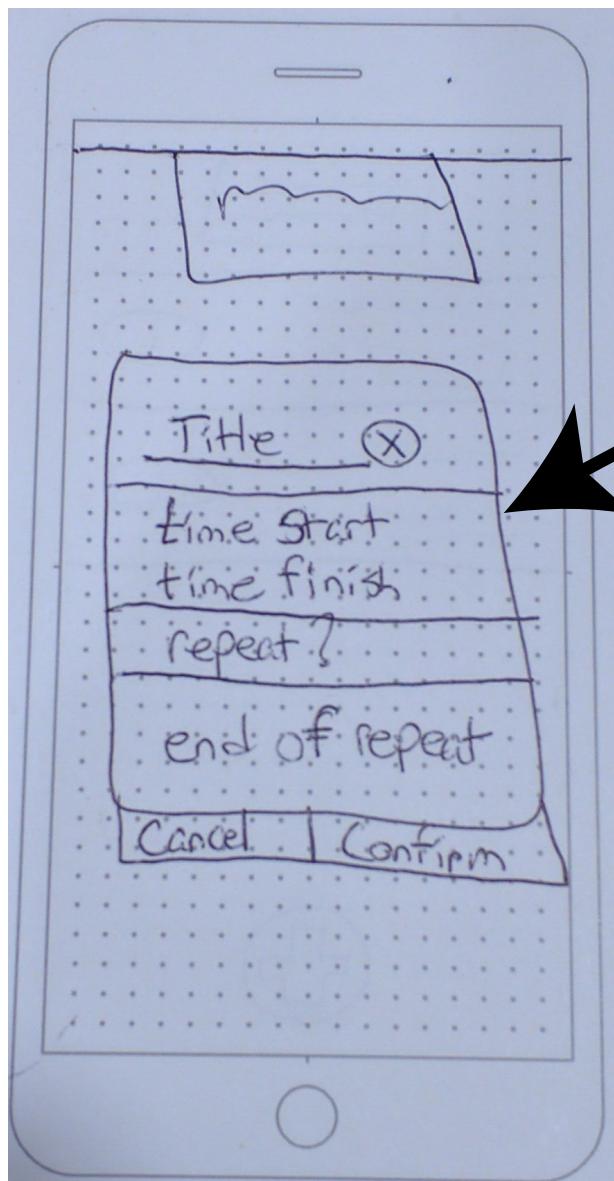

My app will allow users to create specific times when their phones should be silent. An example of this is a student who wants their phone to be silent during their classes each week

The app will have a main view that shows what silent times are present and active. A user can toggle them on or off. As well as swipe to delete them.

A user can add more silent times by clicking a “plus” button at the bottom of the screen.

When a user clicks add, a bubble pops up with fields to customize the new silent time. A user can repeat it based on an end date or after so many days or weeks.

The best thing about this app, is that there are many more features I could add such as syncing with a calendar. The hardest part should be the table view that I will need to implement.
